

# Assembly guide

For Amigo

## Getting started

# INSTALLATION

## Step-by-step instructions

### Task 1

#### STEP 1

→ Once the PCBs arrive you need to SMD solder them.

→ Use solder paste, wick, and flux to do it. Solder all the parts on to it and also don't forget things like key caps for the buttons. Refer to Ki Cad files as instructions for each cap or resistor and anything else you may need.

#### STEP 2

→ 3D print all the STLs from the CAD

→ Use the STLs or regenerate your own from the step file and send them to your printer.

#### STEP 3

→ Attach the PCBs to the case

- Use M3 screws and nuts to secure it using the designated holes for that. The Main board goes into the big box and the buttons attach to the cover and base. Add the rocker switch here too press fit but hot glue or glue is optional.

#### **STEP 4**

- Connect the buttons and main board

- Using jumper wires plug the corresponding connector of both boards in.

#### **STEP 5**

- Place key caps on top of the switches.

- Push the 3D printed key caps onto the buttons.

#### **STEP 6**

- Attach the case together and add battery

- Screw in the rest of the case to secure everything together. Also use M3 screws and nuts. You can slot the battery in the corresponding slot and connect the JST cables.

## STEP 7

→ Charge and Power on

→ Now you can plug it in, turn it on and start using it.

# Dependencies

Summarize dependencies, and list the dependencies and installation instructions.

## Dependency 01

→ You should have all the parts with you. You also need the necessary tools and materials to build it. Things like 3D printer, solder, multimeter, filament, etc.

## Dependency 02

→ You should have some comfortabilty with problem solving. The soldering section may be troublesome because of things like messy soldering or stuff like that which has to be debugged with a multimeter.
